<i>Foreword</i>	v
<i>Preface</i>	vii

CHAPTER 1

Water, Amino Acids and Peptides 1

1. Describe the properties of water that make it most fit solvent in biological systems.	1
2. What is pH and pKa? What is their physiological and clinical significance?	4
3. What is viscosity and hyperviscosity syndrome?	9
4. What is selenocysteine? How is it incorporated into proteins?	9
5. Which is the 22nd amino acid?	12
6. What is isoelectric point or isoelectric pH? How to calculate isoelectric pH of amino acids?	13

CHAPTER 2

Protein Chemistry, Structure and Function 16

1. What are the biological functions of proteins?	16
2. Differentiate between configuration and conformation.	19
3. What are unstructured proteins?.....	20
4. What is salting in and salting out? Why ammonium sulphate is most commonly used for this purpose?	23
5. What are disulfide bonds? How are they formed and what is their significance in protein structure?	27
6. Distinguish between peptides and proteins. Give examples of some important peptides.	33
7. What are domains, folds, motifs and supersecondary structures?	33
8. What is the physiological function of myoglobin?	43
9. Describe the role of haemoglobin in the action of nitric oxide.	44

CHAPTER 3**Enzymes****46**

1. Describe enzyme classification.	46
2. Differentiate between co-factor, co-enzyme and prosthetic group.	47
3. Enumerate various mechanisms of catalysis.	47
4. Differentiate between general and specific acid-base catalysis.	47
5. Give examples of enzyme functioning by covalent catalysis.	48
6. Differentiate between Fischer's 'lock and key model' and Koshland's 'induced fit model' of enzyme action.	48
7. What are conserved residues in enzymes?	48
8. How can enzymes be used to measure blood glucose in lab?	49
9. Give examples of functional enzymes of blood.	49
10. How is measurement of levels of non-functional enzymes of blood useful?	49
11. What are ribozymes? Give examples of ribozymes.	49
12. What are irreversible and reversible reactions?	50
13. How reactions can become functionally irreversible under physiological conditions?	50
14. What is the relation between ΔG , K_{eq} and speed of reaction?	50
15. What are the factors on which reaction rate depends?	50
16. Describe how changes in temperature affect rate of enzyme catalysed reaction.	51
17. How change in pH can affect rate of enzyme catalysed reactions?	51
18. Why is the V_i or the initial rate/velocity of reaction used to study effect of substrate concentration on enzyme activity?	51
19. Describe how can we study the effect of substrate concentration on reaction rate of a multi-substrate reaction.	52
20. Enumerate the different types of graphs used to study the relation of V_i versus substrate concentration.	52
21. Describe organophosphate poisoning.	54
22. What are allosteric enzymes?	54
23. What is passive regulation of enzyme activity?	56
24. Why metabolite flow in most metabolic pathways tends to be unidirectional?	57
25. How can compartmentation/separation of anabolic and catabolic pathways involving same metabolites can be achieved?	57
26. What is rate limiting enzyme of a pathway?	57
27. How are intracellular enzymes degraded?	58
28. In what ways can hormones regulate metabolic enzymes?	58
29. Give examples of different covalent modifications that can regulate enzyme activity.	58
30. What are the advantages of activation by selective proteolysis of pro-enzyme?	58
31. What are the advantages of covalent modification by phosphorylation?	58
32. What are isoenzymes? Describe with examples the significance of isoenzymes in our body.	59

CHAPTER 4**Bioenergetics and Oxidative Phosphorylation****60**

1. What reaction is catalysed by myokinase and what is its advantage?	60
2. What is the difference between ΔG° , $\Delta G^{\circ'}$ and ΔG ? Elaborate with an example.	61
3. How both catabolic and anabolic reactions are made spontaneous or favourable in our body?	62
4. Why the 'high energy phosphate bond' is misnomer or why ATP acts as energy currency molecule?	63

5. How ATP provides energy for endergonic reactions?	64
6. What is the advantage of activation reactions such as acyl CoA synthetase converting ATP to AMP rather than ADP?	65
7. Classify the enzymes involved in oxidation-reduction reactions giving example of each.	68
8. Why names homogentisate oxidase and aldehyde dehydrogenase are misnomers?	68
9. What is hydroxylase cycle?	68
10. Why 2,4-DNP or 2,4-dinitrophenol is a banned drug?	69
11. Describe agents which interfere with oxidative phosphorylation. What is the difference between uncouples and inhibitors of electron transport chain?	69
12. What is the mechanism and features of cyanide toxicity?	71
13. What are conditions which limit the rate of cellular respiration during exercise?	72
14. What are the different states of respiratory control?	72
15. NADPH is required in synthetic reactions in cytosol. Give examples of some intra-mitochondrial reactions requiring NADPH.	73
16. What are the sources of intramitochondrial NADPH?	73
17. Enumerate some oxidants and free radicals that are produced in mitochondria.	73
18. Differentiate between glycerophosphate and malate aspartate shuttle.	73
19. Where else besides inner mitochondrial membrane is glutamate aspartate exchanger found and what is its function there?	74
20. Enumerate some of the transporters present in inner mitochondrial membrane.	74
21. What is the irreversible step in electron transport and how is its rate controlled?	75
22. Oxidative phosphorylation requires the transfer of electrons donated by NADH. (a) Is NADH imported directly into the mitochondria? Explain. (b) Enumerate two import mechanisms that transfer cytosolic electrons from NADH into the mitochondrion. (c) Why is it important to maintain a relatively constant level of cytosolic NAD ⁺ ?	75
23. Explain how 1 NADH produces 2.5 ATP and 1 FADH ₂ produces 1.5 ATP and what is P/O ratio?	76

CHAPTER 5

Carbohydrate Chemistry and Metabolism

77

1. Enumerate the causes responsible for 'withdrawal' of carbohydrate from blood.	77
2. Enumerate the causes for the 'release' of glucose by liver to the blood.	78
3. Give the biochemical basis of muscular cramps and pain associated with vigorous exercise.	78
4. Major source of energy in RBCs is anaerobic glycolysis although oxygen is present. Comment.	78
5. What is 'curd' formation?	78
6. Why are many adults intolerant to milk?	79
7. Galactose is highly toxic if transferase enzyme is missing. How?	80
8. What are the important compounds derived from galactose? How can a galactosaemic child with galactose-free diet cope up?	80
9. How anaerobic exercise training affects glycolysis in athletes?	80
10. Gluconeogenesis in most of the tissues ends at glucose-6-PO ₄ rather than glucose apart from liver. Explain.	81
11. Enlist the proteins required to convert glucose-6-PO ₄ to glucose.	81
12. Differentiate between (a) lactulose and lactose; (b) dextrose and dextrin.	81
13. Differentiate between glycolysis inhibition by arsenite and arsenate.	82
14. Differentiate between glycogen metabolism in liver and muscle.	83
15. Discuss the clinical significance of (a) enolase, (b) transketolase, (c) D-xylose, (d) 2-deoxy-fluoroglucose (FDG), (e) glucagon-like peptide (GLP).	87

16. Enumerate the vitamins that play a key role in citric acid cycle.	90
17. Discuss the biochemical basis of anaemias due to defect in enzymes involved in RBC metabolism.	91
18. Differentiate between the different isoenzymes of hexokinase.	93
19. Why anaerobic metabolism leads to lactic acidosis? Describe the biochemistry behind lactic acidosis and the different types of lactic acidosis. Explain the significance of plasma lactate levels in emergency patients.	95
20. What is D-lactic acidosis?	99
21. What are Pasteur and Warburg effects? Why cancer tissues have increased rate of glycolysis even when sufficient oxygen is available?	100
22. What is metabolic budgeting by pyruvate kinase? Describe the role of its feed forward activation in glycolysis.	102
23. What are anaplerotic, or “Filling Up”, reactions? Why fats are said to be burning in a flame of carbohydrates?	103
24. Explain how excess consumption of sweetened beverages is harmful to health.	106
25. What is the mechanism for hyperuricemia in Von Gierke’s disease?	109
26. Describe the unique structure of glycogen and its advantages.	110

CHAPTER 6

Lipid Metabolism

114

1. Differentiate between ‘ketone’ and ‘ketone bodies’.	114
2. Which produces more ATP: <i>cis</i> - Δ^9 C18:1 or <i>cis</i> - Δ^6 C18:1?	114
3. What is the role of beta oxidation of fatty acids in gluconeogenesis?	114
4. Why is beta oxidation an aerobic process?	116
5. Which organ can produce ketone bodies and which organs can consume ketone bodies?	116
6. Explain how ketone body synthesis is regulated?	116
7. How many ATPs are produced from 1 mol of palmitate when 3- β -hydroxybutyrate is end product?	116
8. What is the clinical manifestation of in-born error with deficiency of HMG CoA synthase?	117
9. Which ketone bodies can be detected by Rothera’s test?	117
10. Out of measurement of ketone bodies in urine or blood, which is the preferred test in a patient of ketoacidosis?	117
11. Why drugs which inhibit fatty acid oxidation are used in treatment of chronic angina?	117
12. In a newborn screening programme dried filter paper blood spot collected for a neonate was found to have elevated C8 acyl carnitine levels. Testing also revealed decreased free carnitine levels. What is the most likely diagnosis? What will be the clinical manifestations? What will be the biochemical basis of treatment?	118
13. Why is coconut oil beneficial for an 8-year-old boy with cystic fibrosis who develops mal-absorption?	118
14. Comment on the dietary therapy used for refractory seizures.	119
15. What are the various uses of ketogenic diet?	119
16. A 3-month-old male infant had facial dysmorphism, hypotonia, psychomotor retardation and hepatomegaly. He had a brother with same facial features and hypotonia who died of hepatic failure at 4 months of age. Biochemical studies (Tandem Mass Spectrometry – TMS) revealed elevation of blood pipecolic acid and VLCFAs. What is the likely diagnosis?	120
17. What is the role of lysolecithin in atherosclerosis?	121
18. Enumerate the useful compounds synthesized during cholesterol synthesis pathway.	121

19. Why is Butylated hydroxyanisole (BHA)/E320 added to packed food items?	122
20. Give examples of drugs for which liposomes are used for delivery.	124
21. What are the various factors regulating fatty acid synthesis?	124
22. Enumerate the essential fatty acids.	124
23. Which unsaturated fatty acids can be synthesized in human body?	124
24. How can diagnosis of essential fatty acid deficiency be confirmed by lab tests?	125
25. Explain giving examples the difference between suicide enzyme and suicide inhibition.	125
26. How is fish oil protective against myocardial infarction (MI)?	126
27. Describe the beneficial actions of ω_3 and ω_6 fatty acids.	126
28. What is the role of liver X receptors in regulation of cholesterol metabolism?	127
29. How are apo B100 and apo B48 are produced from the same gene?	127
30. Which lipoprotein fraction does not move towards charged end in electrophoresis?	127
31. How do adipose tissue obtain glycerol-3-phosphate for TG synthesis?	128
32. Which phospholipase is involved in production of prostaglandins?	128
33. Which compounds contain ceramide?	128
34. Intravenous imiglucerase or recombinant glucocerebrosidase is used in treatment of which disease?	128
35. Which lipid storage disease causes severe demyelination?	129
36. An 8-year girl was admitted for heart/liver transplant. History: CHD in family; xanthomas appeared on legs when she was 2 years old; xanthomas appeared on elbows when she was 4 years old; admitted with MI symptoms when she was 7 years old (Total cholesterol = 1240 mg/dl; Triglycerides = 350 mg/dl; Total cholesterol of father = 355 mg/dl; Total cholesterol of mother = 310 mg/dl); 2 weeks after MI she had coronary bypass surgery; past year she had severe angina and second bypass; despite low-fat diet, cholestyramine and lovastatin therapy, total cholesterol = 1000 mg/dl. What is the likely diagnosis and biochemical explanation for these features?	130
37. Describe briefly the function and consequences of defects in various apolipoproteins and enzymes involved in lipoprotein/lipid transport. Explain with suitable examples the role of LDL and HDL in atherosclerosis. Which is more important – LDL or HDL?	135

CHAPTER 7

Amino Acid and Heme Metabolism

143

1. What are nutritionally essential and non-essential amino acids?	143
2. How can nitrogen balance or protein balance be measured?	143
3. Describe glycine metabolism and associated clinical implications.	144
4. Describe the unique characteristics of branched-chain amino acids metabolism.	149
5. Explain the biochemical basis of maple syrup urine disease and its management.	149
6. How is arginine synthesized in body?	154
7. How is nitrogen transported from tissues for its disposal?	155
8. How many ATPs are required to produce 1 molecule of urea?	156
9. How are amino acids transported across cell membranes?	157
10. Describe the biochemical basis of clinical features of urea cycle defects.	159
11. Explain biochemical basis of management of urea cycle defects.	161
12. What are the causes and effects of tetrahydrobiopterin deficiency? Explain the biochemical basis of management.	163
13. What are the biological functions of heme degradation products – carbon monoxide and bilirubin/biliverdin?	166

CHAPTER 8 Nucleotide Metabolism 168

1. Why pyrimidines and purines are called 'Bases'?	168
2. What is the fate of nucleic acids and nucleotides consumed in diet?	169
3. What are the different biological functions of nucleotides?	171
4. What is salvage pathway and what is its importance?	171
5. Which reactions use PRPP and how its levels are regulated?	172
6. What is tumor lysis syndrome?	173
7. Describe regulation of purine synthesis and its clinical implications.	174
8. Classify the different causes of hyperuricemia and explain the underlying biochemical basis.	176
9. Discuss renal handling of uric acid and its clinical implications.	177
10. What is the role of alcohol in gout?	178
11. Why is hypouricemic therapy not given during attacks of acute gout?	179
12. What is the difference in action of allopurinol in gout and Lesch-Nyhan syndrome (HGPRT deficiency)?	179
13. What is the physiological significance of β -alanine and β -aminoisobutyric acid (BAIBA)?	180
14. What is the difference between xanthine oxidase and xanthine dehydrogenase?	181

CHAPTER 9 Nutrition, Vitamins and Minerals 182

1. What is thermic effect of food?	182
2. How are nutritional recommendations on quantities of different nutrients to be consumed daily made?	183
3. What is FIGLU test? What are the functions of folate in body and why daily intake is required if it is a coenzyme? Which other tests are used to detect folate deficiency?	184
4. What is folate trap? Explain its biochemical basis.	186
5. Excessive intake of vitamin D can cause toxicity but excessive exposure to sunlight does not, why?	187
6. What are the different actions of vitamin D?	190
7. What is glycemic index and glycemic load?	191
8. What is protein quality and how is protein quality assessed?	192
9. What is the pharmacological application of niacin and its biochemical basis?	195
10. Enumerate nutritional/dietary factors related to risk of metabolic syndrome and cardiovascular diseases.	196
11. What are goitrogenic factors? How selenium deficiency affects thyroid function?	197
12. What are the different consequences of Iodine deficiency and their biochemical basis?	198
13. What are the different consequences of iodine excess and their biochemical basis?	204

CHAPTER 10 Genetics 207

1. What is DNA tautomerization and what is its significance?	207
2. What is DNA damage and mutation? What are differences between them?	209
3. Describe the different types of DNA damages and their causes.	210
4. What are the consequences of DNA damage/mutations?	215
5. What is photoreactivation?	217
6. Why combination therapy is required in HIV treatment?	218

7. What is proofreading by DNA polymerase and how does it occur?	219
8. Why primer is required for DNA replication?	220
9. What is end replication problem?	220
10. What are the similarities and differences between eukaryotes and prokaryotes in DNA replication?	223
11. A 3-year-old male child presented with brownish-black pigmentation on the sun exposed part of the body like face, hands and neck at the age of 2 years. Dry skin was also evident. He also complained of burning sensation on exposure to sunlight. There were no other findings. What is the probable diagnosis? How can it be confirmed and managed?	226

CHAPTER 11

Membrane and Transport 230

1. What are the different types of lipids present in membranes and their significance?	230
2. Describe the role and functions of cholesterol in plasma membranes.	234
3. How are proteins held in the plasma membranes?	236
4. What is asymmetric distribution of lipids? How is it maintained and what is its significance?	239
5. What are lipid rafts and caveolae and what is their significance?	241
6. What are the factors which affect membrane fluidity?	246
7. How are transport proteins classified?	248
8. What are the similarities between transporters and enzymes?	249
9. What are pore-forming toxins and ionophores?	249
10. What are ABC transporters and describe their clinical significance.	252

CHAPTER 12

Integration of Metabolism and Endocrinology 255

1. How is eating behaviour regulated in humans?	255
2. Describe the changes in metabolism in starve–feed cycle and with different phases of glucose homeostasis.	260
3. What is the significance of AMP-activated protein kinase?	269
4. What is the biochemical basis of harmful effects of obesity?	272
5. Why there is hyperlipoproteinemia in DM when there is lack of insulin (or insulin resistance) as insulin increases lipid synthesis? What are the differences in metabolic abnormalities in type 1 DM and type 2 DM?	277
6. What are calcimimetics? What is their mechanism of action and use?	280
7. Explain how teriparatide (recombinant PTH 1-34) can be used for treatment of osteoporosis.	282
8. How hormones effect gene expression? What are HREs? What are nuclear receptors and nuclear receptors with special ligands? Describe their characteristic structural features.	284

CHAPTER 13

Glycoproteins, ECM and Protein Trafficking 290

1. What is sugar code of life or how carbohydrates can carry biological information?	290
2. Describe the general structure and classification of proteoglycans and their functions.	293
3. Differentiate between heparin and heparan sulphate.	304
4. Describe role of oligosaccharides in protein folding.	305
5. What are lectins, their significance and applications?	308

CHAPTER 14 Organ Function Tests 313

1. What is serum–ascites albumin gradient? 313
2. What is the biochemical basis of development of ascites in cirrhosis? 314
3. How to distinguish pleural or other fluids as transudate or exudate by biochemical tests? 315
4. Describe the utility of different biochemical tests in liver diseases. 316
5. Describe the cell-based model of coagulation. Describe its advantages over the cascade/
waterfall model. 327

CHAPTER 15 Immunology 338

1. Describe the antiviral defence of innate immune system. 338
2. Explain the biochemical basis of tolerance. Give some therapeutic applications of the
phenomena of tolerance. 342
3. Explain biochemical basis of autoimmunity, give examples of some autoimmune diseases. 348
4. How are transplant grafts rejected? Explain the immune mechanisms and describe the methods
used to prevent graft rejection. 354
5. What are superantigens? 365
6. What are isotypes, allotypes and idiotypes? 367
7. What are cryoglobulins and cold agglutinins? 369

CHAPTER 16 Xenobiotic Metabolism, Antioxidants and Biochemistry of Ageing 373

1. What are xenobiotics? How are they metabolized and what is the importance of their bio-
transformation? 373
2. What can be the harmful effects of xenobiotics? 376
3. How are xenobiotics metabolized? 376
4. Give examples of the reactions of xenobiotic metabolism participating in metabolism of
endogenous compounds. 384
5. Give examples of some xenobiotics activated during their metabolism. 384
6. What is the effect of caloric restriction on longevity? 386
7. Describe the relative importance of various antioxidants. Why exogenous antioxidant
supplements have little effect or may even be harmful? 388

Index 391
